

Startup Proposal: KrishiYug

Brand Name: KrishiYug

Industry: Agri-FinTech / InsurTech

Role: Online Insurance Agent

1. Executive Summary

KrishiYug is an innovative online insurance agency platform designed to bridge the gap between farmers and insurance providers. By streamlining the registration, policy purchase, and claim verification processes, KrishiYug aims to provide a transparent and efficient ecosystem for agricultural insurance management. The platform utilizes a three-tier user architecture—Farmers, Insurance Companies, and Admin—to ensure seamless operations and verified claim processing.

2. Platform Ecosystem & User Roles

The platform is built around three primary stakeholders, each with specific functionalities designed to automate the insurance lifecycle.

2.1 Farmers (The Insured)

Farmers serve as the primary end-users of the platform, with features focused on accessibility and ease of claim filing.

- **Account Management:** Self-registration and secure login capabilities.
- **Insurance Procurement:** Ability to browse insurance companies, buy specific policies, and purchase recommended insurance policies directly within the app.
- **Claim Submission:** A robust interface for claiming insurance, which includes uploading multimedia evidence (images and videos) and adding official tag numbers for identification.
- **Tracking:** Real-time tracking of insurance claim status and purchase history.

2.2 Insurance Companies (The Providers)

Insurance providers use the platform to manage their offerings and process claims validated by the agent.

- **User Oversight:** Capability to view registered users associated with their policies.
- **Claim Management:** Access to view pending claims and the corresponding verification status provided by the Admin.
- **Decision Making:** Functionality to refund or reject insurance claims based on provided evidence.
- **Communication:** Reporting claim and acceptance status back to the Admin (KrishiYug).

2.3 Admin (KrishiYug - The Agent)

The Admin acts as the central facilitator and verification body for all transactions on the platform.

- **Onboarding:** Registering and managing new insurance company partners.
- **Centralized View:** Oversight of all registered users and detailed access to farmer claim documents (multimedia evidence).
- **Policy Management:** Adding and managing the application's policy frameworks.
- **Verification & Reporting:** Updating claim verification statuses based on evidence from farmers and sending comprehensive verification claim reports to the respective insurance companies.

3. Key Use Case Workflow

Process Phase	Primary Actor	Description
Policy Acquisition	Farmer	Farmer registers, browses recommended policies, and purchases insurance through the app.
Claim Initiation	Farmer	Farmer submits a claim by uploading images, videos, and tag numbers as proof of loss.
Verification	Admin	Admin reviews the farmer's documents, updates the verification status, and generates a report for the insurer.
Claim Processing	Insurance Co.	Insurer reviews the Admin-verified report and decides to either refund or reject the claim.

4. Value Proposition

- **For Farmers:** Reduces the complexity of insurance paperwork and provides a digital trail for all claims, ensuring they are not ignored.
- **For Insurers:** Reduces fraud through the Admin-mediated verification process and provides a direct digital channel to the agricultural market.
- **Efficiency:** Digital multimedia evidence (images/videos) accelerates the traditional assessment timeline.
